

1a AI is a branch of computer science that focuses on creating machines or software that focuses can perform tasks typically requiring human intelligence

2a ML stands for Machine Learning. It is a branch of artificial intelligence that focuses on developing algorithms that allow computer to learn from and make decisions or predictions based on data, without being explicitly programmed for each specific task

3a A subfield of machine learning that uses neural networks with many layers its model complex patterns in data. It's used for tasks like

image recognition, natural language processing,
and speech recognition. It's often used in
medical contexts such as measuring blood glucose
levels.
